xtsum — Summarize xt data

**Description**

xtsum, a generalization of summarize (see [R] summarize), reports means and standard deviations for panel data; it differs from summarize in that it decomposes the standard deviation into between and within components.

**Quick start**

Report means and overall, between, and within standard deviations for all numeric variables in xtset data

\[ \text{xtsum} \]

As above, but restrict to v1, v2, and v3

\[ \text{xtsum} \ v1 \ v2 \ v3 \]

As above, but calculate statistics separately for each level of catvar

\[ \text{bysort catvar: xtsum} \ v1 \ v2 \ v3 \]

**Menu**

Statistics > Longitudinal/panel data > Setup and utilities > Summarize xt data
Syntax

\texttt{xtsum [varlist] [if]}

A panel variable must be specified; use \texttt{xtset}; see [XT] \texttt{xtset}.

\texttt{varlist} may contain time-series operators; see [U] 11.4.4 Time-series varlists.

by is allowed; see [D] by.

Remarks and examples

If you have not read [XT] \texttt{xt}, please do so.

\texttt{xtsum} provides an alternative to \texttt{summarize}. For instance, in the \texttt{nlswork} dataset described in [XT] \texttt{xt}, \texttt{hours} contains the usual hours worked:

\begin{verbatim}
use https://www.stata-press.com/data/r16/nlswork
(National Longitudinal Survey. Young Women 14-26 years of age in 1968)
.summarize hours

<table>
<thead>
<tr>
<th>Variable</th>
<th>Obs</th>
<th>Mean</th>
<th>Std. Dev.</th>
<th>Min</th>
<th>Max</th>
</tr>
</thead>
<tbody>
<tr>
<td>hours</td>
<td>28467</td>
<td>36.55956</td>
<td>9.869623</td>
<td>1</td>
<td>168</td>
</tr>
</tbody>
</table>

.xtsum hours

<table>
<thead>
<tr>
<th>Variable</th>
<th>Mean</th>
<th>Std. Dev.</th>
<th>Min</th>
<th>Max</th>
<th>Observations</th>
</tr>
</thead>
<tbody>
<tr>
<td>hours</td>
<td>36.55956</td>
<td>9.869623</td>
<td>1</td>
<td>168</td>
<td>N = 28467</td>
</tr>
<tr>
<td></td>
<td>7.846585</td>
<td>1</td>
<td>83.5</td>
<td></td>
<td>n = 4710</td>
</tr>
<tr>
<td></td>
<td>7.520712</td>
<td>-2.154726</td>
<td></td>
<td>130.0596</td>
<td>T-bar = 6.04395</td>
</tr>
</tbody>
</table>

\end{verbatim}

\texttt{xtsum} provides the same information as \texttt{summarize} and more. It decomposes the variable \( x_{it} \) into a between \((\bar{x}_i)\) and within \((x_{it} - \bar{x}_i + \bar{x})\), the global mean \( \bar{x} \) being added back in make results comparable). The overall and within are calculated over 28,467 person-years of data. The between is calculated over 4,710 persons, and the average number of years a person was observed in the \texttt{hours} data is 6.

\texttt{xtsum} also reports minimums and maximums. Hours worked last week varied between 1 and (unbelievably) 168. Average hours worked last week for each woman varied between 1 and 83.5. “Hours worked within” varied between \(-2.15\) and 130.1, which is not to say that any woman actually worked negative hours. The within number refers to the deviation from each individual’s average, and naturally, some of those deviations must be negative. Then the negative value is not disturbing but the positive value is. Did some woman really deviate from her average by \(+130.1\) hours? No. In our definition of within, we add back in the global average of 36.6 hours. Some woman did deviate from her average by \(130.1 - 36.6 = 93.5\) hours, which is still large.

The reported standard deviations tell us something that may surprise you. They say that the variation in hours worked last week across women is nearly equal to that observed within a woman over time. That is, if you were to draw two women randomly from our data, the difference in hours worked is expected to be nearly equal to the difference for the same woman in two randomly selected years.

If a variable does not vary over time, its within standard deviation will be zero:

\begin{verbatim}
.xtsum birth_yr

<table>
<thead>
<tr>
<th>Variable</th>
<th>Mean</th>
<th>Std. Dev.</th>
<th>Min</th>
<th>Max</th>
<th>Observations</th>
</tr>
</thead>
<tbody>
<tr>
<td>birth_yr</td>
<td>48.08509</td>
<td>3.012837</td>
<td>41</td>
<td>54</td>
<td>N = 28534</td>
</tr>
<tr>
<td></td>
<td>3.051795</td>
<td>1</td>
<td>83.5</td>
<td></td>
<td>n = 4711</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>48.08509</td>
<td>48.08509</td>
<td>T-bar = 6.05689</td>
<td></td>
</tr>
</tbody>
</table>

\end{verbatim}
Stored results

`xtsum` stores the following in `r()`:

Scalars

- `r(N)` number of observations
- `r(n)` number of panels
- `r(Tbar)` average number of years under observation
- `r(mean)` mean
- `r(sd)` overall standard deviation
- `r(min)` overall minimum
- `r(max)` overall maximum
- `r(sd_b)` between standard deviation
- `r(min_b)` between minimum
- `r(max_b)` between maximum
- `r(sd_w)` within standard deviation
- `r(min_w)` within minimum
- `r(max_w)` within maximum
