estat gof — Goodness-of-fit statistics

Syntax

estat gof [ , options ]

options

Description

stats(statlist) statistics to be displayed
nodescribe suppress descriptions of statistics

statlist

Description

chi2 \( \chi^2 \) tests; the default
rmsea root mean squared error of approximation
ic information indices
indices indices for comparison against baseline
residuals measures based on residuals
all all the above

Note: The statistics reported by chi2, rmsea, and indices are dependent on the assumption of joint normality of the observed variables.

Menu

Statistics > SEM (structural equation modeling) > Goodness of fit > Overall goodness of fit

Description

estat gof is for use after sem but not gsem.
estat gof displays a variety of overall goodness-of-fit statistics.

Options

stats(statlist) specifies the statistics to be displayed. The default is stats(chi2).
stats(chi2) reports the model versus saturated test and the baseline versus saturated test. The saturated model is the model that fits the covariances perfectly.
The model versus saturated test is a repeat of the test reported at the bottom of the sem output.
In the baseline versus saturated test, the baseline model includes the means and variances of all observed variables plus the covariances of all observed exogenous variables. For a covariance model (a model with no endogenous variables), the baseline includes only the means and variances of observed variables. Be aware that different authors define the baseline model differently.
estat gof — Goodness-of-fit statistics

stats(rmsea) reports the root mean squared error of approximation (RMSEA) and its 90% confidence interval, and pclose, the \( p \)-value for a test of close fit, namely, RMSEA < 0.05. Most interpreters of this test label the fit close if the lower bound of the 90% CI is below 0.05 and label the fit poor if the upper bound is above 0.10. See Browne and Cudeck (1993).

stats(ic) reports the Akaike information criterion (AIC) and Bayesian (or Schwarz) information criterion (BIC). These statistics are available only after estimation with \texttt{sem method(ml)} or \texttt{method(mlmv)}. These statistics are used not to judge fit in absolute terms but instead to compare the fit of different models. Smaller values indicate a better fit. Be aware that there are many variations (minor adjustments) to statistics labeled AIC and BIC. Reported here are statistics that match \texttt{estat ic}; see \texttt{[R] estat ic}.

To compare models that use statistics based on likelihoods, such as AIC and BIC, models should include the same variables; see \texttt{[SEM] lrtest}. See Akaike (1987), Schwarz (1978), and Raftery (1993).

stats(indices) reports CFI and TLI, two indices such that a value close to 1 indicates a good fit. CFI stands for comparative fit index. TLI stands for Tucker–Lewis index and is also known as the nonnormed fit index. See Bentler (1990).

stats(residuals) reports the standardized root mean squared residual (SRMR) and the coefficient of determination (CD).

A perfect fit corresponds to an SRMR of 0. A good fit is a small value, considered by some to be limited to 0.08. SRMR is calculated using the first and second moments unless \texttt{sem option nomeans} was specified or implied, in which case SRMR is calculated based on second moments only. Some software packages ignore the first moments even when available. See Hancock and Mueller (2006, 157).

Concerning CD, a perfect fit corresponds to a CD of 1. CD is like \( R^2 \) for the whole model.

stats(all) reports all the statistics. You can also specify just the statistics you wish reported, such as

\[ \texttt{. estat gof, stats(indices residuals)} \]

\texttt{nodescribe} suppresses the descriptions of the goodness-of-fit measures.

Remarks and examples

See \texttt{[SEM] example 4}. 
Stored results

`estat gof` stores the following in `r()`:

Scalars

- `r(chi2_ms)` test of target model against saturated model
- `r(df_ms)` degrees of freedom for `r(chi2_ms)`
- `r(p_ms)` p-value for `r(chi2_ms)`
- `r(chi2_bs)` test of baseline model against saturated model
- `r(df_bs)` degrees of freedom for `r(chi2_bs)`
- `r(p_bs)` p-value for `r(chi2_bs)`
- `r(rmsea)` root mean squared error of approximation
- `r(lb90_rmsea)` lower bound of 90% CI for RMSEA
- `r(ub90_rmsea)` upper bound of 90% CI for RMSEA
- `r(pclose)` p-value for test of close fit: RMSEA < 0.05
- `r(aic)` Akaike information criterion
- `r(bic)` Bayesian information criterion
- `r(cfi)` comparative fit index
- `r(tli)` Tucker–Lewis fit index
- `r(cd)` coefficient of determination
- `r(srmr)` standardized root mean squared residual
- `r(N_groups)` number of groups

Matrices

- `r(nobs)` sample size for each group
