Description

`ladder` searches a subset of the ladder of powers (Tukey 1977) for a transform that converts `varname` into a normally distributed variable.

`gladder` and `qladder` each display a graph matrix. `gladder` displays nine histograms of transforms of `varname` according to the ladder of powers. `qladder` displays the quantiles of transforms of `varname` according to the ladder of powers against the quantiles of a normal distribution.

Quick start

Table showing Tukey’s ladder of powers transformations for `v`

```
ladder v
```

As above, but with separate tables for each level of the categorical variable `catvar`
```
by catvar: ladder v
```

Display transformations graphically using histograms
```
sladder v
```

As above, but using quantile plots
```
qladder v
```

Menu

`ladder`
Statistics > Summaries, tables, and tests > Distributional plots and tests > Ladder of powers

`gladder`
Statistics > Summaries, tables, and tests > Distributional plots and tests > Ladder-of-powers histograms

`qladder`
Statistics > Summaries, tables, and tests > Distributional plots and tests > Ladder-of-powers quantile-normal plots
Syntax

Ladder of powers

```
ladder varname [if] [in] [, generate(newvar) noadjust]
```

Ladder-of-powers histograms

```
gladder varname [if] [in] [, histogram_options combine_options]
```

Ladder-of-powers quantile–normal plots

```
qladder varname [if] [in] [, qnorm_options combine_options]
```

by is allowed with ladder; see [D] by.

Options for ladder

- `generate(newvar)` saves the transformed values corresponding to the minimum chi-squared value from the table. We do not recommend using `generate()` because it is literal in interpreting the minimum, thus ignoring nearly equal but perhaps more interpretable transforms.
- `noadjust` is the `noadjust` option to `sktest`; see [R] `sktest`.

Options for gladder

- `histogram_options` affect the rendition of the histograms across all relevant transformations; see [R] `histogram`. Here the `normal` option is assumed, so you must supply the `nonormal` option to suppress the overlaid normal density. Also, `gladder` does not allow the `width(#)` option of `histogram`.
- `combine_options` are any of the options documented in [G-2] `graph combine`. These include options for titling the graph (see [G-3] `title_options`) and for saving the graph to disk (see [G-3] `saving_option`).

Options for qladder

- `qnorm_options` affect the rendition of the quantile–normal plots across all relevant transformations. See [R] `diagnostic plots`.
- `combine_options` are any of the options documented in [G-2] `graph combine`. These include options for titling the graph (see [G-3] `title_options`) and for saving the graph to disk (see [G-3] `saving_option`).
Example 1: ladder

We have data on the mileage rating of 74 automobiles and wish to find a transform that makes the variable normally distributed:

```
. use http://www.stata-press.com/data/r14/auto
(1978 Automobile Data)
. ladder mpg

<table>
<thead>
<tr>
<th>Transformation</th>
<th>formula</th>
<th>chi2(2)</th>
<th>P(chi2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>cubic</td>
<td>mpg^3</td>
<td>43.59</td>
<td>0.000</td>
</tr>
<tr>
<td>square</td>
<td>mpg^2</td>
<td>27.03</td>
<td>0.000</td>
</tr>
<tr>
<td>identity</td>
<td>mpg</td>
<td>10.95</td>
<td>0.004</td>
</tr>
<tr>
<td>square root</td>
<td>sqrt(mpg)</td>
<td>4.94</td>
<td>0.084</td>
</tr>
<tr>
<td>log</td>
<td>log(mpg)</td>
<td>0.87</td>
<td>0.647</td>
</tr>
<tr>
<td>1/(square root)</td>
<td>1/sqrt(mpg)</td>
<td>0.20</td>
<td>0.905</td>
</tr>
<tr>
<td>inverse</td>
<td>1/mpg</td>
<td>2.36</td>
<td>0.307</td>
</tr>
<tr>
<td>1/square</td>
<td>1/(mpg^2)</td>
<td>11.99</td>
<td>0.002</td>
</tr>
<tr>
<td>1/cubic</td>
<td>1/(mpg^3)</td>
<td>24.30</td>
<td>0.000</td>
</tr>
</tbody>
</table>
```

If we had typed `ladder mpg, gen(mpgx)`, the variable `mpgx` containing $1/\sqrt{\text{mpg}}$ would have been automatically generated for us. This is the perfect example of why you should not, in general, specify the `generate()` option. We also cannot reject the hypothesis that the inverse of `mpg` is normally distributed and that $1/\text{mpg}$—gallons per mile—has a better interpretation. It is a measure of energy consumption.
Example 2: gladder

gladder explores the same transforms as ladder but presents results graphically:
```
    . gladder mpg, fraction
```

Histograms by transformation

Technical note

gladder is useful pedagogically, but be careful when using it for research work, especially with many observations. For instance, consider the following data on the average July temperature in degrees Fahrenheit for 954 U.S. cities:
```
    . use http://www.stata-press.com/data/r14/citytemp
    (City Temperature Data)
    . ladder tempjuly
    Transformation   formula        chi2(2)   P(chi2)
                        cubic        tempjuly^3      47.49    0.000
                        square       tempjuly^2      19.70    0.000
                        identity     tempjuly        3.83    0.147
                        sqrt          sqrt(tempjuly)   1.83    0.400
                        log           log(tempjuly)    5.40    0.067
                        1/sqrt        1/sqrt(tempjuly) 13.72    0.001
                        inverse       1/tempjuly      26.36    0.000
                        1/square      1/(tempjuly^2)    64.43    0.000
                        1/cubic       1/(tempjuly^3)   .        0.000
```

The period in the last line indicates that the $\chi^2$ is very large; see [R] sktest.
From the table, we see that there is certainly a difference in normality between the square and square-root transform. If, however, you can see the difference between the transforms in the diagram below, you have better eyes than we do:

```
. gladder tempjuly, ltitle("") ylabel(none) xlabel(none)
```

![Average July temperature](Histograms by transformation)

**Example 3: qladder**

A better graph for seeing normality is the quantile–normal graph, which can be produced by `qladder`. 
This graph shows that for the square transform, the upper tail—and only the upper tail—diverges from what would be expected. This divergence is detected by `sktest` (see [R] `sktest`) as a problem with skewness, as we would learn from using `sktest` to examine `tempjuly` squared and square rooted.
Stored results

`ladder` stores the following in `r()`:

Scalars

- `r(N)` number of observations
- `r(invcube)` $\chi^2$ for inverse-cubic transformation
- `r(P_invcube)` significance level for inverse-cubic transformation
- `r(invsq)` $\chi^2$ for inverse-square transformation
- `r(P_invsq)` significance level for inverse-square transformation
- `r(inv)` $\chi^2$ for inverse transformation
- `r(P_inv)` significance level for inverse transformation
- `r(invsqrt)` $\chi^2$ for inverse-root transformation
- `r(P_invsqrt)` significance level for inverse-root transformation
- `r(log)` $\chi^2$ for log transformation
- `r(P_log)` significance level for log transformation
- `r(sqrt)` $\chi^2$ for square-root transformation
- `r(P_sqrt)` significance level for square-root transformation
- `r(ident)` $\chi^2$ for untransformed data
- `r(P_ident)` significance level for untransformed data
- `r(square)` $\chi^2$ for square transformation
- `r(P_square)` significance level for square transformation
- `r(cube)` $\chi^2$ for cubic transformation
- `r(P_cube)` significance level for cubic transformation

Methods and formulas

For `ladder`, results are as reported by `sktest`; see [R] `sktest`. If `generate()` is specified, the transform with the minimum $\chi^2$ value is chosen.

`gladder` sets the number of bins to $\min(\sqrt{n}, 10 \log_{10} n)$, rounded to the closest integer, where $n$ is the number of unique values of `varname`. See [R] `histogram` for a discussion of the optimal number of bins.

Also see Findley (1990) for a ladder-of-powers variable transformation program that produces one-way graphs with overlaid box plots, in addition to histograms with overlaid normals. Buchner and Findley (1990) discuss ladder-of-powers transformations as one aspect of preliminary data analysis. Also see Hamilton (1992, 18–23) and Hamilton (2013, 129–132).

Acknowledgment

`qladder` was written by Jeroen Weesie of the Department of Sociology at Utrecht University, The Netherlands.
