

stteffects — Treatment-effects estimation for observational survival-time data[Description](#) [Syntax](#) [Also see](#)

Description

stteffects estimates average treatment effects, average treatment effects on the treated, and potential-outcome means using observational survival-time data. The available estimators are regression adjustment, inverse-probability weighting, and more efficient methods that combine regression adjustment and inverse-probability weighting.

For a brief description and example of each estimator, see *Remarks and examples* in [TE] **stteffects intro**.

Syntax

stteffects *subcommand* ... [, *options*]

<i>subcommand</i>	Description
ra	regression adjustment
ipw	inverse-probability weighting
ipwra	inverse-probability-weighted regression adjustment
wra	weighted regression adjustment
