

validscale: A Stata module to validate subjective measurement scales using Classical Test Theory

Bastien Perrot, Emmanuelle Bataille, Jean-Benoit Hardouin

UMR INSERM U1246 - SPHERE "methodS in Patient-centered outcomes and HEalth ResEarch", University of Nantes, University of Tours, France

bastien.perrot@univ-nantes.fr

French Stata Users Group Meeting, July 6, 2017

Context

- We use questionnaires to measure non-observable characteristics/traits
 - personality traits
 - aptitudes, intelligence
 - quality of life
 - ...
- The questionnaires are subjective measurement scales providing one or several scores based on the sum (or mean) of responses to items (binary or ordinal variables)

Hospital Anxiety and Depression Scale (Zigmond and Snaith, 1983)

Chart I — Hospital Anxiety and Depression Scale

This questionnaire will help your physician know how you are feeling. Read every sentence. Place an "X" on the answer that best describes how you have been feeling during the LAST WEEK. You do not have to think too much to answer. In this questionnaire, spontaneous answers are more important. Mark only one answer for each question.

A (1) I feel tense or wound up:

- 3 () Most of the time
- 2 () A lot of times
- 1 () From time to time
- 0 () Not at all

D (2) I still enjoy the things I used to:

- 0 () Definitely as much
- 1 () Not quite so much
- 2 () Only a little
- 3 () Hardly at all

A (3) I get a sort of frightened feeling as if something awful is about to happen:

- 3 () Very definitely and quite badly
- 2 () Yes, but not too badly
- 1 () A little, but it doesn't worry me
- 0 () Not at all

D (4) I can laugh and see the funny side of things:

- 0 () As much as I always could
- 1 () Not quite as much now
- 2 () Definitely not so much now
- 3 () Not at all

A (5) Worrying thoughts go through my mind:

- 3 () Most of the time
- 2 () A lot of times
- 1 () From time to time
- 0 () Only occasionally

D (6) I feel cheerful:

- 0 () Most of the time
- 1 () Usually
- 2 () Not often
- 3 () Not at all

A (7) I can seat at ease and feel relaxed:

- 0 () Definitely
- 1 () Usually
- 2 () Not often
- 3 () Not at all

D (8) I feel as if I am slowed down:

- 3 () Nearly all the time
- 2 () Very often
- 1 () From time to time
- 0 () Not at all

A (9) I get a sort of frightened feeling like butterflies in the stomach:

- 0 () Not at all
- 1 () From time to time
- 2 () Quite often
- 3 () Very often

D (10) I have lost interest in my appearance:

- 3 () Definitely
- 2 () I don't take so much care as I should
- 1 () I may not take quite as much care
- 0 () I take just as much care as ever

A (11) I feel restless, as if I had to be on the move:

- 3 () Very much indeed
- 2 () Quite a lot
- 1 () Not very much
- 0 () Not at all

D (12) I look forward with enjoyment to things:

- 0 () As much as I ever did
- 1 () A little less than I used to
- 2 () Definitely less than I used to
- 3 () Hardly at all

A (13) I get a sudden feeling of panic:

- 3 () Very often indeed
- 2 () Quite often
- 1 () From time to time
- 0 () Not at all

D (14) I can enjoy a good TV or radio program or book:

- 0 () Often
- 1 () Sometimes
- 2 () Not often
- 3 () Hardly at all

Validity and reliability of a questionnaire

In order to be useful, a questionnaire must be **valid** and **reliable**.

Validity and reliability of a questionnaire

In order to be useful, a questionnaire must be **valid** and **reliable**.

Validity refers to the degree to which a questionnaire measures the concept(s) of interest accurately (e.g. anxiety and depression).

- content validity
- structural validity
- convergent validity
- divergent validity
- concurrent validity
- known-groups validity

Validity and reliability of a questionnaire

In order to be useful, a questionnaire must be **valid** and **reliable**.

Validity refers to the degree to which a questionnaire measures the concept(s) of interest accurately (e.g. anxiety and depression).

- content validity
- structural validity
- convergent validity
- divergent validity
- concurrent validity
- known-groups validity

Reliability refers to the degree to which a questionnaire measures the concept(s) of interest consistently (e.g. Are there enough items ? Are the scores reproducible ?)

- internal consistency
- reproducibility
- ("scalability")

Validity and reliability of a questionnaire

In order to be useful, a questionnaire must be **valid** and **reliable**.

Validity refers to the degree to which a questionnaire measures the concept(s) of interest accurately (e.g. anxiety and depression).

- content validity
- structural validity
- convergent validity
- divergent validity
- concurrent validity
- known-groups validity

Reliability refers to the degree to which a questionnaire measures the concept(s) of interest consistently (e.g. Are there enough items ? Are the scores reproducible ?)

- internal consistency
- reproducibility
- ("scalability")

These properties can be assessed using Classical Test Theory (CTT) or Item Response Theory (IRT)

Rationale for `validscale`

- Validity and reliability are assessed using statistical analyses (e.g. Factor Analyses, Intraclass Correlation Coefficients, etc.).
- However, there is currently no statistical software package to perform all these tests in an easy way.
- → The objective of `validscale` is to perform the recommended analyses to validate a subjective measurement scale using CTT.

Example dataset : Impact of Cancer Scale (Crespi et al., 2008)

- 37 items (range: 1=strongly disagree to 5=strongly agree) grouped into 8 dimensions measuring impact of cancer
- A French version was administered to a sample of breast cancer survivors (N=371)

Positive impact domains

Altruism and Empathy

1. Having had cancer has made me more willing to help others
2. Because I had cancer I am more understanding of what other people feel
3. I feel a special bond with people with cancer
4. I feel I should give something back to others

Health Awareness

5. Having had cancer has made me more concerned about my health
6. I do not take my body for granted since I had cancer
7. I am more aware of physical problems or changes
8. Having had cancer has made me take better care of myself

- Health Awareness: ioc1-ioc4
- Positive Self-Evaluation: ioc5-ioc8
- Worry: ioc9-ioc15
- Body Change Concerns: ioc16-ioc18
- Appearance Concerns: ioc19-ioc21
- Altruism and Empathy: ioc22-ioc25
- Life Interferences: ioc26-ioc32
- Meaning Of Cancer: ioc33-ioc37

Syntax

```
validscale varlist, partition(numlist)
```

varlist contains the variables (items) used to compute the scores. The first items of *varlist* compose the first dimension, the following items define the second dimension, and so on.

partition allows defining in *numlist* the number of items in each dimension. The number of elements in this list indicates the number of dimensions.

```
. validscale ioc1-ioc37, part(4 4 7 3 3 4 7 5)
```

```

Confirmatory factor analysis

Warning: some items have less than 7 response categories. If multivariate normality assumption does not hold, maximum likelihood estimation might not be appropriate. Consider using `cfasb` in order to apply Satorra-Bentler adjustment or using `cfamethod(adf)`.

Covariances between errors added: `e.ioc1*e.ioc3`

Number of used individuals: 292

Item	Dimension	Factor loading	Standard error	Intercept	Standard error	Error variance	Variance of dimension

sf12mcs: Mental Component Scale of the Short-Form 12

sf12pcs: Physical Component Scale of the Short-Form 12

(Ware Jr et al., 1996)

## Example of a complex syntax

To obtain the above results:

```
. validscale ioc1-ioc37, part(4 4 7 3 3 4 7 5) scorename(HA PSE
W BCC AC AE LI MOC)categories(1 5) impute(pms) noround
compscore(sum) descitems graphs cfa cfamethod(ml) cfastand
cfacov(ioc1*ioc3) convdiv tconvdiv(0.4)convdivboxplots
alpha(0.7) delta(0.9) h(0.3) hjmin(0.3) repet(ioc1_2-ioc37_2)
kappa ickappa(500)kgv(chim) kgvboxplots kgvgroupboxplots
conc(sf12mcs sf12pcs) tconc(0.4)
```

Or use the dialog box:

```
. db validscale
```

# Dialog box

ValidScale

General | Confirmatory factor analysis | Convergent/divergent validities | Reliability | Reproducibility | Known-groups validity | Concurrent validity

Items used for computing score:  Number of items:

Items used:

Partition:

Response categories:

Define the names of the dimensions:

Or use scores from the dataset:

Computation of scores

- Mean
- Sum
- Standardize scores from 0 to 100

Missing data handling

- No imputation
- Person Mean Substitution
- Multiple Imputation
- Do not round imputed values

Options

- Descriptive analysis of the items
- Display graphs

# Dialog box

Validscale

General | **Confirmatory factor analysis** | Convergent/divergent validities | Reliability | Reproducibility | Known-groups validity | Concurrent validity

Perform confirmatory factor analysis

Estimation method:

- Maximum likelihood
- Maximum likelihood with Satorra-Bentler adjustment
- Maximum likelihood with missing values
- Asymptotic distribution free

Standardize coefficients

Covariances between measurements errors:

- Manually add covariances (ex : item1\*item5 item12\*item16 ... )
- Automatically add covariances until RMSEA is less than:
- Automatically add covariances until CFI is greater than:
- Stop when one the two criteria is met (default is both)

Assert covariances between dimensions to be zero

? R [ ] OK Cancel Submit

# Summary

- `validscale` performs the recommended analyses (under CTT) to assess the reliability and validity of a questionnaire
- A dialog box allows using the command in a user-friendly way (type `. db validscale`)
- Warning/error messages are displayed to help the user during the analysis
- `ssc install validscale`
