The effect of a treatment or exposure on an outcome

< □ > < 同 > < 回 > < 回 > < 回 >

The effect of a treatment or exposure on an outcome

• Average treatment effect (ATE) and average treatment effect on the treated (ATET)

< □ > < 同 > < 回 > < 回 > < 回 >

The effect of a treatment or exposure on an outcome

- Average treatment effect (ATE) and average treatment effect on the treated (ATET)
- teffects: cross-sectional data selection on observables
- didregress and xtdidregress: repeated-measures selection on unobservables
- Estimation, inference, visualization, diagnostics, and tests

- 4 回 ト 4 ヨ ト 4 ヨ ト

The effect of a treatment or exposure on an outcome

- Average treatment effect (ATE) and average treatment effect on the treated (ATET)
- teffects: cross-sectional data selection on observables
- didregress and xtdidregress: repeated-measures selection on unobservables
- Estimation, inference, visualization, diagnostics, and tests
- One treatment effect. That assumes that the treatment does not change over groups or time. Homogeneous treatment effects
- New: Heterogeneous treatment effects for selection on unobservables. Heterogeneous Difference in differences (DID). Multiple ATETs

A D N A B N A B N A B N

Starting point: Why heterogeneous treatment effects?

• DID with different groups treated at different times

< □ > < 同 > < 回 > < 回 > < 回 >

Starting point: Why heterogeneous treatment effects?

- DID with different groups treated at different times
- With multiple treatment times the ATET for DID was obtained via

$$y_{it} = \beta_0 + D_{it}\beta_1 + \gamma_t + \gamma_g + e_{it}$$

- β_1 is the ATET
- A generalization of the well understood 2 by 2 model.

▲ □ ▶ ▲ □ ▶ ▲ □

Starting point: Why heterogeneous treatment effects?

- DID with different groups treated at different times
- With multiple treatment times the ATET for DID was obtained via

$$y_{it} = \beta_0 + D_{it}\beta_1 + \gamma_t + \gamma_g + e_{it}$$

- β_1 is the ATET
- A generalization of the well understood 2 by 2 model.
- Two-way fixed-effects (TWFE) was criticized in the last six years
- Why:
 - Homogeneity (well understood)
 - 2 Hidden cost of generalizing of 2 by 2

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

What happens when we go beyond the 2 by 2 model?

- ATET might be different for groups treated at different times
- Within groups, ATET might change over time
- If this is the case:

$$y_{it} = \beta_0 + D_{it}\beta_1 + \gamma_t + \gamma_g + e_{it}$$

< □ > < 同 > < 回 > < 回 > < 回 >

What happens when we go beyond the 2 by 2 model?

- ATET might be different for groups treated at different times
- Within groups, ATET might change over time
- If this is the case:

$$y_{it} = \beta_0 + D_{it}\beta_1 + \gamma_t + \gamma_g + e_{it}$$

- Weighted average
 - Borusyak, Jaravel, and Spiess (2018)
 - de Chaisemartin and D'Haultfoeuille (2020)
 - Goodman-Bacon (2021) (estat bdecomp)

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

• β_1 is a weighted average of (2 by 2) estimates

$$y_{it} = \beta_0 + D_{it}\beta_1 + \gamma_t + \gamma_g + e_{it}$$

- 2 by 2 estimates using:
 - Never treated groups
 - 2 Early treated groups
 - 3 Later treated groups

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

• β_1 is a weighted average of (2 by 2) estimates

$$y_{it} = \beta_0 + D_{it}\beta_1 + \gamma_t + \gamma_g + e_{it}$$

- 2 by 2 estimates using:
 - Never treated groups
 - 2 Early treated groups
 - 3 Later treated groups
- Some of the comparisons are valid comparisons. Some are not.
- Validity: satisfying a parallel-trends assumption.

What have we learned?

- With multiple treatment times, traditional DID assumes homogeneity
- 2 by 2 comparisons are well defined, but not all are useful
 - Comparison group matters
 - Time of comparison matters
- With multiple treatment times, it is important to assess heterogeneity
- If we suspect heterogeneity or do not want to assume homogeneity,

Image: A Image: A

What have we learned?

- With multiple treatment times, traditional DID assumes homogeneity
- 2 by 2 comparisons are well defined, but not all are useful

 - Time of comparison matters
- With multiple treatment times, it is important to assess heterogeneity
- If we suspect heterogeneity or do not want to assume homogeneity, use hdidregress and xthdidregress

Image: A Image: A

Heterogeneous treatment effects approaches

- Solution 1: Callaway and Sant'Anna (2021)
 - Use valid comparison groups
 - Split the problem into 2 by 2 comparisons
 - Compute ATET(g, t), where g is the cohort and t is the time
- Solution 2: Wooldridge (2021)
 - (Do not blame the messenger) Include heterogeneity in your regression
 - Add the adequate interactions with cohort and time
 - Compute ATET(g, t), where g is the cohort and t is the time
 - Computing ATET(g) or ATET(t) is also possible
- Other solutions exist. Good surveys are Roth et al. (2022) and de Chaisemartin and D'Haultfoeuille (forthcoming)

イロト 不得 トイラト イラト 一日

Framework I

$$Y_{it} = Y_{it}(0) + \sum_{g=2}^{T} [Y_{it}(g) - Y_{it}(0)] G_{ig}$$

- Y_{it} observed outcome
- Y_{it}(0) potential outcome of not being treated
- G_{ig} is an indicator for treatment group
- g is the time at which a group of individuals is treated (cohort)
- $Y_{it}(g)$ potential outcome for cohort g

- 4 回 ト 4 ヨ ト 4 ヨ ト

Framework II

- Treatment is staggered
- Parallel trends
- No anticipation
- Overlap

A D N A B N A B N A B N

Callaway and Sant'Anna

- Regression adjustment (RA)
- Inverse-probability weighting (IPW)
- Augmented inverse-probability weighting (AIPW)

< □ > < 同 > < 回 > < 回 > < 回 >

$$ATET(g,t) = E\left\{\frac{G_g}{E(G_g)}\left[Y_t - Y_{g-1} - m_{gt}(X)\right]\right\}$$

•
$$m_{gt}(X) = E(Y_t - Y_{g-1}|X, C = 1)$$

• ${\it C}=1$ is the never treated group (${\it G}_g=\infty)$

$$ATET(g,t) = E\left\{\frac{G_g}{E(G_g)}\left[Y_t - Y_{g-1} - m_{gt}(X)\right]\right\}$$

- ATET(g, t) is calculated using two groups: g and C = 1, never treated
- Outcomes are computed for two points in time

イロト 不得下 イヨト イヨト 二日

$$ATET(g,t) = E\left\{\frac{G_g}{E(G_g)}\left[Y_t - Y_{g-1} - m_{gt}(X)\right]\right\}$$

- ATET(g, t) is calculated using two groups: g and C = 1, never treated
- Outcomes are computed for two points in time
- 2 by 2 idea
- This is done for all g and all t
- We could have other 2 by 2 comparisons, i.e, using the not yet treated
- Identification assumptions are the same but need to hold for each 2 by 2

< □ > < □ > < □ > < □ > < □ > < □ >

Heuristically

- keep if time is t or g-1
- 2 keep if cohort is g or cohort is C = 1

3 generate
$$Y_t - Y_{g-1} \equiv \Delta Y_t$$

• regress ΔY on X for C=1 and predict, $\widehat{m}_{gt}(X)$

9 generate
$$\Delta Y - \widehat{m}_{gt}(X) = \widehat{TE}$$

- **o** summarize \widehat{TE} if cohort is g
 - This is done for each g and t
 - Doing it for all is a GMM problem, Callaway and Sant'Anna use influence functions.

• • = • • =

IPW

$$ATET(g,t) = E\left\{ \left(\frac{G_g}{E(G_g)} - \frac{\frac{p_g(X)}{1 - p_g(X)}}{E\left[\frac{p_g(X)}{1 - p_g(X)}\right]} \right) [Y_t - Y_{g-1}] \right\}$$

- $p_g(X) = P(G_g = 1 | X, G_g + C = 1)$, i.e., conditional on the sample we keep
- Steps are similar to before with the additional computation of $\hat{p}_g(X)$ and the quotient $\frac{\hat{p}_g(X)}{\hat{E}\left[\frac{\hat{p}_g(X)}{1-\hat{\rho}_g(X)}\right]}$

イロト イポト イヨト イヨト 二日

AIPW

$$ATET(g,t) = E\left\{ \left(\frac{G_g}{E(G_g)} - \frac{\frac{p_g(X_1)}{1 - p_g(X_1)}}{E\left[\frac{p_g(X_1)}{1 - p_g(X_1)}\right]} \right) \left[Y_t - Y_{g-1} - m_{gt}(X_2) \right] \right\}$$

• Notice $m_{gt}(X_2)$. Emphasizes we could have different covariates

 AIPW is doubly robust. You may incorrectly specify at least one of m_{gt}(X₂) or p_g(X₁) and still recover ATET(g, t)

How to interpret my results

- I might want an average over all the ATET(g, t)
- I might want to know the effect of treatment within each group
- I might want to know the effect of treatment within a particular year
- I might want to see how the effect evolves with the duration of treatment
